## SUMMARY

Third-year CSE (Cybersecurity) student with a strong grounding in data structures, algorithms, and object-oriented programming (C++, Python), backed by hands-on full-stack engineering experience across Django, FastAPI, PostgreSQL, and React. Comfortable owning a problem end to end – API design, modular architecture, and testing – and picking up new codebases quickly. Co-author of two peer-reviewed papers (IEEE ComSoc, BEDAIML 2026).

## EDUCATION

### Dayananda Sagar University

*B.Tech in Computer Science and Engineering (Cybersecurity specialization)*

Bangalore, India

2024 – 2028

– Coursework: Data Structures & Algorithms, Object-Oriented Programming, Database Management Systems, Machine Learning, Network Security

## EXPERIENCE

### Operations Manager

Oct 2024 – Jan 2026

*Entrepreneurship Cell, DSU (DERBI / AIC-DSU)*

Bangalore, India

– Coordinated cross-functional teams and managed technical deliverables and timelines for startup initiatives across two incubators, communicating status and blockers to multiple stakeholders.

### Backend Contributor (Side Project)

Jul 2025 – Mar 2026

*VeerNeo*

Bangalore, India

– Built and iterated on backend features for a generative AI product in a small team, incorporating feedback across development cycles.

## PROJECTS

### Web Vulnerability Scanner | *Python, Django, FastAPI, Docker*

[GitHub](#)

- Designed a modular, containerized (Docker) scanning pipeline with a Django and FastAPI backend, isolating each detection module so it could be tested and extended independently.
- Implemented REST endpoints for common web vulnerability checks (XSS, SQLi, IDOR, open redirect, port scanning) and automated PDF reporting, using structured debugging to keep defects low across iterations.

### Fraud Detection System | *Django REST Framework, PostgreSQL, React*

- Built REST APIs with Django REST Framework backed by PostgreSQL to serve predictions from an ensemble ML model, using SMOTE to handle severe class imbalance in transaction data.
- Built a Streamlit dashboard for model and transaction monitoring, on top of a React front end consuming the DRF APIs.

### AI Phishing Simulation Platform (PhishGuard) | *Python, Django, Scikit-learn*

[GitHub](#)

- Shipped a full-stack Django platform end to end, from requirements through implementation and testing, to simulate phishing attacks and track user susceptibility with behavioral profiling.
- Implemented Random Forest for classification and Isolation Forest for anomaly detection, producing structured, data-driven risk reports for adaptive training.

## TECHNICAL SKILLS

**Languages:** Python, C++ (DSA – active LeetCode practice), JavaScript, SQL, C, Bash

**Frameworks & Tools:** Django, Django REST Framework, FastAPI, React, PostgreSQL, REST APIs, Docker, Git

**Practices:** Object-Oriented Programming, SDLC, modular system design, query optimization, testing & structured debugging

**AI/ML:** Scikit-learn, Random Forest, Isolation Forest, Generative AI

**Security:** Vulnerability analysis, web app pentesting, Kali Linux, Burp Suite (learning)

## PUBLICATIONS

- Energy-Aware Edge Intelligence for Smart Cities – *IEEE ComSoc, 2026*
- Deepfake Detection Survey (adversarial media, detection countermeasures) – *BEDAIML Conference, 2026*
